

## How to Make Pollinator Pods

1. Make the soil matrix (this is already provided here, we have a sign up if you want additional information)
2. Take a pinch of enough soil matrix to create a tiny, dime-sized ball. Put 3 seeds inside. Large seeds can be deep inside the pollinator pods, while small seeds should be near the surface – they won't be able to break out from deep inside the pollinator pod to germinate
3. Roll the pod
4. Dry them for 24-48 hours in the sun
5. Store in a cardboard box or sow

## How to Plant

1. Throw them on the ground!
2. You can also press them gently into the soil about  $\frac{1}{2}$  way down
